

Project Sentinel Hypothesis

CLASSIFIED LVL5

Project Sentinel is a top-secret ASR project based off previous AXU research into wireless transmission and weaponizing waveforms to win the Rubicona War. The research was then shut down after a severe security incident.

During the Rubicona war the AXU struggled to keep up with the enemy's increasing strength and had to develop some new methods of fighting back against the JS empire and the Outcasts. Most of these methods failed such as bomb raids and chemical warfare however the idea of remotely killing or disabling the enemies before they even attacked became an idea. The solution was to create a machine capable of creating lag waves at different frequencies and amplitudes in hope it would be able to affect the enemy and reduce their ability to engage in combat (without affecting anyone else).

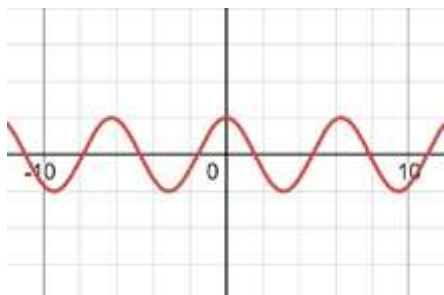

Fig 1 – Here is an example of a wave. It has two parameters: **Frequency** and **Amplitude**. The x axis is the frequency, and the y axis is the amplitude.

Within just a few days a plan for the machine was developed, the Meta-Overload-Redstone-Array. Or MORA for short. It was to consist of several Redstone clocks that would run at different frequencies. They would range from 10Hz all the way down to 0.1Hz. The user was to select a frequency they wanted to use and then flip 3 safety switches and a master control switch to allow the current to pass to the array. The array was made of 8 large cylinders each having a different amplitude. They went in the order: 1, 2, 4, 8, 16, 32, 64, and 128. By

using a combination of the amplitude levels, you could create any number from 1 to 256. And the change in current in these cylinders would create the lag wave. The AXU was aware this idea could work but the frequency range simply wasn't enough to specify what they were targeting, and it was not

currently possible to go higher than 20Hz without external modification that would most certainly be difficult to obtain.

All of this meant the AXU was incapable of filtering what to target with MORA however there is still benefits to a double-edged sword. The enemy could be disabled if enough force was put into it. And if the AXU used something such as Opti-fine or Sodium they could just about avoid it. However long-distance-communications would have been extremely damaged. Alongside this MORA would also disable players across the server. So obviously... it was postponed until some sort of filtering became possible.

Not long after all this the JS empire gained occupation of Rubicon. When the AXU made a push back to Rubicon construction immediately began. However, a general who reported MORA to the server staff got the Lord in trouble and MORA was destroyed. Later after that "mini-mora's" began to pop up however they all went on the same frequency and had negligible amplitude. They became a waste of Redstone and were dismantled to make the cost of nuclear devices lower. This was the end of the AXU's involvement.

Almost 6 months later after the collapse of the AXU the ASR (successor) began to show interest in wireless communications to make more room for Redstone instead of having long cables. It was around this time a method of detecting these waves became apparent. By using a range of clocks like in MORA but each goes straight into a waterfall display when a lag wave hits the clocks, they create a short delay, and if strong enough, an irregular wave. It was thought that using lag waves were the only way until it was discovered that by using a special FPS graph you can truly see the relationship between FPS and lag, and there was an anomaly. There was another kind of wave, previously unknown. Despite the strong connection between these waves and the lag waves it could be possible to create these waves without the lag. Around this time the idea of using specialized rectifiers before the waterfall that only rectify the frequency their designed for. And would pass only the effected waves making irregularities far easier to spot once detected.

Hopefully in future when the ASR has enough resources to continue the pursuit of these mystery waves, they will be truly understood and utilized changing the world of the ASR forever.
